Rht gene; homologue; Triticum aestivum; wheat; growth inhibition; antagonist; gibberellin; dwarf phenotype; gibberellin biosynthesis; paclobutrazol; rice; expressed sequence tag; EST.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Triticum Aestivum polynucleotides - encode a polypeptide whi
provides inhibition of the growth of plants, which inhibition is
antagonised by gibberellin, used to confer a dwarf phenotype
                                                                                                                                                                                                                                                 Protein encoded by rice EST D39460 sequence.
                                                                                                                                            AAY02538 standard; Protein; 256 AA.

ESTs derived from mRNAs encoding secreted proteins. The 5. ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. ESTs sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in solating cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.

The specification describes polypeptides encoded by the Rht gene (and its homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antegonised by a globerellin. The products can be used to provide Rht expression in glibberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin insensitive. Taller plants wild-type, the dwarfing being gibberellin insensitive. Taller plants to the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, compounds which inhibit gibberellin biosynthesis inhibitor to keep weeds dwarfibut let crop plants grow tall. The present sequence is encoded by rice expressed sequence tag (EST) AAD39460, which is homologous to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ő

Sequence 102, Application US/0878933F

Batent No. 6153380

GENERAL INFORMATION:
APPLICANT: NO. 6153380an, Garry P

APPLICANT: NO. 6153380an, Garry P

TITLE OF INVENTION: METHODS FOR SCREENING FOR TRANSDOMINANT INTRACELLULAR

TITLE OF INVENTION: EFFECTOR PEPTIDES AND RNA MOLECULES

TITLE OF INVENTION: EFFECTOR PEPTIDES AND RNA MOLECULES

TITLE OF INVENTION: EFFECTOR PEPTIDES AND RNA MOLECULES

CURRENT APPLICATION NUMBER: US/08/789,333F

CURRENT FILING DATE: 1997-01-23

PRIOR FILING DATE: 1996-01-23

PRIOR FILING DATE: 1996-01-23

NUMBER OF SEQ 1D NOS: 102

achatin. achains achain. Aschains and a chain a filican snail N; Contains: achain. I C; Species: Achain. II
N; Contains: Achain a fulica (giant African snail)
C; Species: Achain a fulica (giant African snail)
C; Species: Achain. I contains (c) accession: A32480
R; Kamatani, Y.; Minakata, H.; Kenny, P.T.M.; Iwashita, T.; Watanabe, K.; Funase, K.; Sun R; Kamatani, Y.; Minakata, H.; Kenny, Dilloron, 1015-1020, 1989
Biochem. Biophys. Res. Commun. 160, 1015-1020, 1989
A; Title: Achain. I, an endogenous neuroexcitatory tetrapeptide from Achaina fulica feru A; McCession: A32480; MUID: 89273551
A; McCession: A32480
A; Mote: stereochemistry of the active form confirmed by chemical synthesis

                           This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

Sequences AAV69610-V69611 and AAV69617 represent tachyplesin analogues used in an exemplification of the present invention, in which the native tachyplesin cysteine residues are replaced with Ala. Leu and Asp. respectively. Tachyplesin (AAV69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (V696912-AAV69614, AAV69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the native techyplesin are replaced by the hydrophobic amino acids isoleucine, rachyplesin are replaced by the hydrophobic amino acids isoleucine, rachyplesin are replaced by the hydrophobic amino acids isoleucine, rachyplesin are replaced by the hydrophobic amino acids isoleucine, rachyplesin are replaced by the analogues are useful for intramolecular disulphide bonds, the analogues are functional as intramolecular disulphide bonds, the analogues are useful for controlling fungal and viral activity in agricultural and medical applications and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, and viruses. Note: The present sequence is not shown in the specification, but is derived from the generic tachyplesin analogue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungl pathogenic to plants e.g. Fusarium graminearum, Essarium moniforme, Sclerotinia sclerotiorum, Sclerotinia trifolorum and Aspergilus flavus. The peptides can also be used for treating and preventing infection in humans and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The new derivatives are linear and lack the gents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus,

                                                                                                                                                                                                                                                                                                        δŏ
                                                                                                                                                                                                                                      g
This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active apents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic
                                                                                                                                                                                                                                            and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells

The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia articolorum, and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and
                                              The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections

                                                                                                                                                                                                                                                                                                                                                                                                              AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fundi, in particular for fundi pathogenic to plants e.g. Fusarium morificarme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

This sequence represents a generic tachyplesin (TP) analogue which has antimicrobial activity. Tachyplesin (AAK09608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAK09614, AAK09616) in which cert ecysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophoic amino acids isoleucine, value, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medical applications and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants to provide resistance to pathogenic fungi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /label= Ile, Val, Met, Phe, Tyr

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocyptes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monificame, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin

The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungl, in particular for fungi pathogenic to plants e.g. Fusarium moliforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, tibozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents to cytoplasm and nor-liver active agents, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Linear; tachyplesin; peptide antibiotic; beta-sheet; secondary structure; disulphide bridge; antibody; ribozyme; antitumour agent; antiviral; anti-inflammatory; mammal; cell membrane; passive transport; cytoplasm;
               haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium monilforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

                                                                                                                                                                                                                    The lipopolysaccharide-binding polypeptides may be prepd. by either solid-phase peptide synthesis followed by oxidn. to form the disulphide bridges or, subjecting horseshoe crab haemcoytes to hypotonic extraction, extracting the residue with acid, and purifying the extract. The polypeptides have high affinity for lipopolysaccharide (LPS) endotoxins and are useful for removing such toxins from fluids, as antibacterial agents, eg active against Salmonella spp. and S. aureus, and for treating LPS-mediated immune and inflammatory disorders, eg superior trachebonochial infections, unimary tract infections, bedsores, burns, colitis, cirrhosis, hepatic insufficiency and post-operative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 15, Ap Sequence 1, Ap Sequence 16, Ap Sequence 16

Sequence 4, Application US/08168809
Patent No. 5580852
GENERAL INFORMATION:
APPLICANT: Putnam, Rebecca J.
APPLICANT: Rao, Aragula G.
TITLE OF INVENTION: DERIVATIVES OF TACHYPLESIN HAVING
TITLE OF INVENTION: INHIBITORY ACTIVITY TOWARDS PLANT PATHOGENIC FUNGI
                                                                                                                          APPLICANT: Fulli, No. 5449752utaka
APPLICANT: Yamamoto, Naoki
APPLICANT: Yamamoto, Naoki
APPLICANT: Matsumoto, Akiyoshi
APPLICANT: Matsumoto, Akiyoshi
APPLICANT: Minohimori
TITLE OF INVENTION: Lipopolysaccharides With Affinity To
TITLE OF INVENTION: Lipopolysaccharides And Their Uses
NUMBER OF SEQUENCES: 39
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennile & Edmonds
STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

Sequence I. Application US/08962034.

Patent No. 6015941.

GNERRAL INFORMATION: PEPTIDE DERIVATIVES OF TACHYPLESIN TITLE OF INVENTION: HAVING ANTIMICROBIAL ACTIVITY NUMBER OF SEQUENCES: 2

CORRESPONDENCE ADDRESS: ADDRESSE: Bell Seltzer IP Group of Alston & Bird STREET: NC

COUNTRY: US

INFORMATING STEEN IN COUNTRY: US

COMPUTER: US

COMPUTER: IBM PC COMPATIBLE

OPPRATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.30

COMPUTER: IBM PC COMPATION:

MEDICATION NUMBER: US/08/962,034

FILICATION NUMBER: 32,943

REGISTRATION NUMBER: 32,943

REGISTRATION NUMBER: 5718-19

TELECOMMUNICATION INFORMATION:

NAME: Spruill, W MUNICAY

REFERENCE/DOCKET NUMBER: 5718-19

TELECHONE: 919 420 2202

TELECHONE: 919 420 2202

TELECHONE: 17 amino acids

TYPPE: amino acids

TYPPE: amino acids

TOPOLOGY: Linear

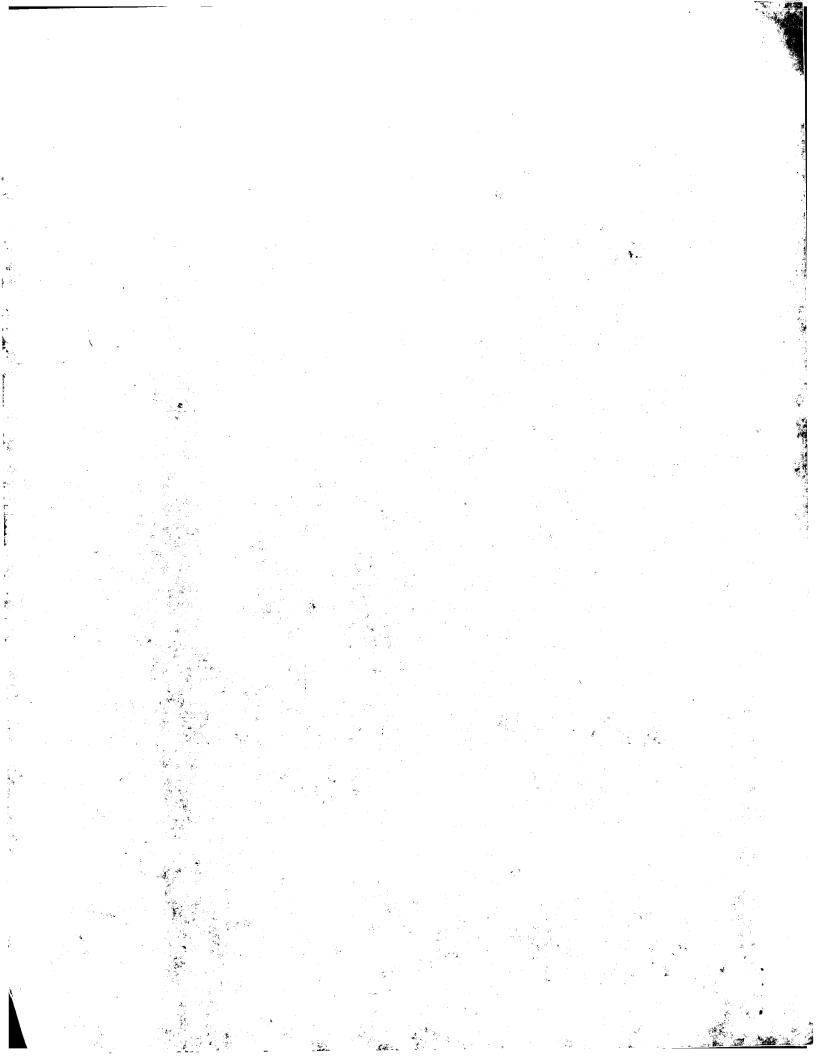

MOLECULE TYPE: peptide

A.Title: Sequence and analysis of chromosome 2 of the plant Arabidopsis thaliana.
A.Reference number: A84420; MUID:20083487
A.Status: preliminary
C; Superfamily: serine carboxypeptidase
C; Keywords: glycoprotein; hydrolase; serine carboxypeptidase
C; L481, Product: carboxypeptidase D *status experimental <MAT>
F; 1-481, 218, 256, 326, 384, 392, Binding site: carbohydrate (Asn) (covalent) *status experimenta
